

My name is Joe Godleski and I am a developer located in Alpharetta, Georgia who is currently looking for a remote position that is at least half frontend work. For the last eight years, I've done full stack development for an electronic medical records company. The first six years was spent on a 1 - 2 person team maintaining and enhancing an existing patient tracking application comprised of Flash displays launched and configured through a web portal and pulling information from Java based Rules Engine and Message Router and an Oracle database. For the last two and half years I've been working on a rewriting an existing application for the Cloud using TypeScript, Angular 1.4, and SASS on the frontend, and .NET Web API webservices, and a SQL Server database on the backend. This latest project was spent on Agile teams of about 6 developers and 2 QC members. In the Spring we started transitioning to Angular 2/4, and I'm hoping to be able to continue working with this technology.
